CodeCite

By Harold Sikkema / harold.sikkema@sheridancollege.ca
Updated September 2024

This infographic offers perspectives on academic integrity and its overlap with personal and professional concerns in the context of coding practices in a design classroom. A new section about Artificial Intelligence has been added in 2024. Feedback, suggestions, and corrections are welcomed. Icons are from FontAwesome, custom artwork is by Adriansyah, Adrien Coquet, Aenne Brielmann, Bjorn Andersson, Carlos Sarmento, and Grant Taylor and Symbolon from the thenounproject.com

Take credit for your own work

Students will only claim credit for their own ideas, writing, projects and creations.

TIP: Take pride in your work. Center your own unique voice.

Recognize & reference the work of others

Students will give proper recognition and reference:

- Where others have contributed
- Where non- original ideas have been included

TIP: Relying on others is a strength, not a weakness. Citing sources demonstrates your resourcefulness as a coder. It looks good on you!

Academic Citations

Add academic citations to a bibliography. Give properly formatted recognition to others whose ideas you have used. Submit together with your supporting process document in PDF format. You can find Style Guides for MLA and other common standards at the Sheridan Library

All Guides: MLA Style (9th ed.): Getting Started
Find more resources on APA citation style.
sheridancollege.libguides.com

TIP: In a coding context, “proper” formatting standards can be vague. Take heart: the principle of recognition matters more than style. Ugly recognition is far more “proper” than none at all.

/* Code Comments */

Add inline comments to your code. Include URLs linking to relevant sources and chatbot conversations. Differentiate between your own work and that of others. Clarify where you have made adaptations to existing code. Provide helpful context. Code comments may have multiple overlapping purposes: academic, professional, and personal.

TIP: Sign each code comment with your name or initials. This will help you to center your own voice, among all the other comments from peers, and AI chatbots.

Annotated Screenshots

In a design context, your code may be situated within a broader creative practice. A PDF process document is a great way to share **annotated** Screenshots in order to tell the full story of your learning. Highlight the “ahal” moments in your own code. Use annotations to define your relationship with chatbots and other online sources.

TIP: Customize your screenshots to make them more impactful. Use annotation layers to get your point across. (e.g. circle the part that matters). Use cropping to highlight the relevant section.

Screen Recordings

Similar to annotated screenshots, a narrated video screencast is another great way to communicate your learning journey. Include your own voice in the audio track to establish a confident point of view.

TIP: A concise video is more impactful. Be kind to your viewer, and cut out unnecessary clips.

Let's Code!

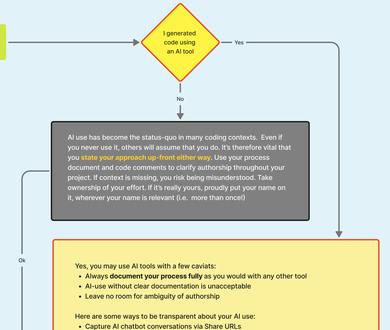
Artificial Intelligence



CAN YOU PROVE IT?

No, AI detection is not reliable. We cannot prove anything about your process. In this context, it's good to remember that integrity has always been something that we co-create. Choosing to be transparent is both a vote of confidence in yourself as an author, and an act of care within the academic community.

CONSIDER

What purposes does AI serve within your own creative practice?
Here are some common use cases in the coding context.

- to solve technical problems
- to build strategies for a new direction
- to scaffold an initial starting point or template
- to find out what others have done in your problem space
- to implement technical aspects of a creative vision
- to take away the drudgery (and let you focus on bigger vision)
- to develop and build career skills

REFLECT

Have you developed a reflexive AI practice? Let's think critically about AI.

- What implicit and explicit biases and inaccuracies arise in AI?
- Which voices and perspectives are absent in your AI conversations?
- Are there ethical assumptions at play in the use of AI tools?
- How might the motives of AI companies differ from you own?
- What are the copyright implications of AI use?
- Have you heard of the “Hypercommons”? (Explore the article links below)
- What might Alan Turing have said about ChatGPT?

Transparent AI use	Ambiguous AI use
Documents your ideation process	Obscures your intentions
Showcases a coherent line of inquiry	Is untraceable and lacks meaning
Preserves your individual authorship	Devalues your authorship and identity
Empowers you to take credit for your ideas	Makes credit difficult to assign
Elevates your creative control and agency	Robs you of creative control
Frames AI as subservient to your goals	Makes your goals unclear
Showcases your problem solving mindset	Comes across as bland and mindless
Highlights professionalism and self-awareness	Frustrates your audience
Provides clear and relevant references: e.g. https://chatgpt.com/share/eb80ee8c-114f-4ce0-a45c-11ce7d192b99	Refers only to vague URLs: e.g. https://chatgpt.com
Improves your grade	**Diminishes your grade**

Important Notes

Academic Integrity in the classroom is not only about citing sources, but also demonstrating your learning process in a transparent way. Use code comments and supporting PDF documentation to validate your understanding. Show your reader that you know what you're doing.
/* I made a for loop to iterate over a list of people and display their name.*/
When learning code, you won't always know exactly what you're doing: and that's also part of the process! It's fine to use code that already exists, as long as you cite it properly, document your own iteration and/or adaptation of the code.
/* I don't know exactly how particle systems work but I'm grateful to Daniel Shiffman for making this one. I have adjusted the colour and size for my own needs. */
Don't assume that you must always make things from scratch: this is very rarely the case. Most of the time coding in community is preferable!
/* Show some love to your GitHub friends */
